Agent-Reach: Give Your Agent Eyes on the Whole Internet, No API Fees

Kabui, Charles

2026-06-29

Read at ToKnow.ai

A developer released Agent-Reach, one command-line tool that lets an AI agent read and search about a dozen platforms with no API fees. Point Claude Code, Cursor, or any agent at it and it pulls tweets, Reddit threads, YouTube subtitles, GitHub repos, Bilibili videos, RSS feeds, and XiaoHongShu posts. It chains free, open tools: yt-dlp for subtitles across 1,800+ video sites, the GitHub gh CLI, feedparser for RSS, Jina Reader to turn any page into clean

text, and Exa for full-web search on a free key. Six of nine channels work the moment you install. It is MIT-licensed, runs on Python 3.10+, and gives each platform a primary route plus a backup, so when Bilibili blocked yt-dlp the tool switched to bili-cli with no action from users.

Official platform APIs are expensive or locked: Twitter search costs money, Reddit blocks anonymous reads. Agent-Reach routes around that for nothing, the only cost a $1/month proxy if your network blocks a site. A researcher can have an agent gather opinions across X and Reddit, summarize a video, and check release notes without paying or writing scraper code. Cookies stay on your machine, nothing uploads, and one command reports what works.

The hard limits here are legal, not technical. Reading platforms through cookies and scrapers crosses many terms-of-service lines, and access breaks whenever a site patches, which is why the fallback routing exists. ToKnow.ai covered OpenResearcher, which trained agents with no live web access; Agent-Reach is the opposite bet, giving them eyes everywhere.
