AI This Week: Patreon Blocks Training Bots, GPT-Red Attacks Models, and Google Puts AI Into Biosecurity

Kabui, Charles

2026-07-19

Read at ToKnow.ai

Patreon began blocking known AI training crawlers at the network level with Cloudflare, while still allowing search crawlers that send readers back to creators. Patreon says early tests cut individual training bots from thousands of weekly access attempts to zero, but no independent

audit backs that figure. OpenAI also introduced GPT-Red, an internal model trained through self-play to attack other models with prompt injections. In OpenAI's held-out test, GPT-Red found successful attacks in 84% of scenarios, compared with 13% for human red-teamers. GPT-5.6 Sol now fails on 0.05% of GPT-Red's direct attacks, according to OpenAI.

Google DeepMind and Isomorphic Labs reported more than 15 biosecurity partnerships in 12 months. Their plans include adapting SynthID to mark AI-generated biological sequences and using AlphaEvolve to improve outbreak detection. Google Vids added prompt-based video editing and personal avatars for paid AI and Workspace users, with age and regional limits. SpaceXAI released Grok Automations for scheduled jobs, while email triggers require SuperGrok. It also published Grok Build's coding-agent harness under Apache 2.0, including its agent loop, tools, terminal interface, and local-inference support.

Put together, the releases show why background AI needs stronger controls. A scheduled agent can read email and use connected tools without a live prompt. A biology model can help with outbreak response, but generated sequences also need screening. Crawler blocks, attack testing, access limits, and provenance marks are becoming part of the product.
