GitHub Trending Is All Agent Tools, Not Models

Kabui, Charles

Read at ToKnow.ai

Seven of GitHub's trending repositories this week share a theme: none of them are new models. They make existing AI agents more useful. CLI-Anything from Hong Kong University converts GUI applications like Blender and draw.io into command-line interfaces that coding agents can control directly. CodeGraph pre-indexes a codebase into a local knowledge graph so agents can understand project structure without repeated file reads. AgentMemory gives

coding agents persistent memory across sessions. OpenHuman, written in Rust, runs as a fully private AI assistant with no data leaving your machine. And andrej-karpathy-skills is a single CLAUDE.md file, derived from Karpathy's observations on LLM coding mistakes, that tells Claude Code how to avoid common pitfalls like hallucinating imports and writing overly clever abstractions.

CLI-Anything lets a developer say "automate my Blender workflow" and the agent can do it, because every menu and button becomes a CLI command. CodeGraph cuts token usage by giving agents a pre-built map of your code instead of making them search file by file. Agent-Memory means your agent remembers what it learned about your project yesterday instead of starting from zero. These solve the three biggest complaints about coding agents: they can't control GUI tools, they waste context on repeated file reads, and they forget everything between sessions.

A year ago, open source was racing to release smaller, cheaper models. Now the most active category is the infrastructure above: tooling, instructions, and adapters that turn models into useful agents. The bottleneck isn't intelligence. It's the agent's ability to see, remember, and interact with the developer's actual environment.
