Reve 2.0: An Image Model That Builds a Layout First, Then Draws

Kabui, Charles

Read at ToKnow.ai

Reve, a Palo Alto research lab, released Reve 2.0, an image model that refuses to turn your prompt straight into pixels. Instead, it first builds a layout: a structured map where every object, text block, and region has its own position, size, and description. Only then does it render the layout as a native 4K image. Plain text is ambiguous: tweak one word and the whole picture can change. A layout is explicit and editable, like HTML is to a web page. The

model is a single Large Layout Model, built by training open-source Qwen language models on billions of images for spatial reasoning. It debuted at #2 on the Arena text-to-image leaderboard, a 125-point jump over the previous version, while training on 10x fewer GPUs.

With a normal generator, fixing one detail in an otherwise good image means re-rolling the whole prompt and hoping the good parts survive. Reve 2.0 treats every element as a separate, self-contained piece, so you can move a subject, rewrite the sign on a wall, or swap a background while the rest of the scene stays put. A designer can fix an ad's headline without regenerating the whole image, and AI agents can read and edit the layout directly, the way they edit code.

This reframes image generation as something closer to writing editable code than rolling dice. The bet is that the bottleneck is no longer raw image quality but control. On the same leaderboard, Reve 2.0 edged out Google's Nano Banana 2, which also renders native 4K but still turns a prompt straight into pixels.
