World Labs Atlas: One AI Model That Generates, Reconstructs, and Simulates 3D Worlds

Kabui, Charles

2026-09-08

Read at ToKnow.ai

On September 1, World Labs, the startup co-founded by computer vision pioneer Fei-Fei Li, unveiled Atlas, a single model that works with text, images, video, and 3D at once. Each image is pinned to a 3D camera position, so scenes hold together as the viewpoint moves. From one

or a few photos it generates video along any camera path, up to a minute at 1440p, and it rebuilds a real room from as few as two or three ordinary phone photos into an interactive 3D scene, outputting point clouds or 3D Gaussian splats. The same model simulates too: it reframes a few phone feeds into "bullet time" shots and generates the image and depth data a robot would see moving through a scanned space.

The pitch is that one generalist beats many specialists. With third-party human raters, Atlas won for following a requested camera move over MiniMax H3 75% of the time, Gemini Omni Flash 81%, and Seedance 2.5 94%. Its sparse-view 3D reconstruction error was 25.3, below the best specialist Pi3X at 28.7. A filmmaker can stage a shot after the shoot, and a robotics team can scan a room with a phone, then generate endless training variations in simulation instead of filming each one. Atlas is in early access for select partners, so these are World Labs' own numbers until outsiders can reproduce them.

World models are moving from video prediction toward geometry you can move through and hand to robots. One model replacing several specialists would simplify today's 3D pipelines, if it holds up beyond the demo.
